KINETIC-LIGHT-INSTALLATION

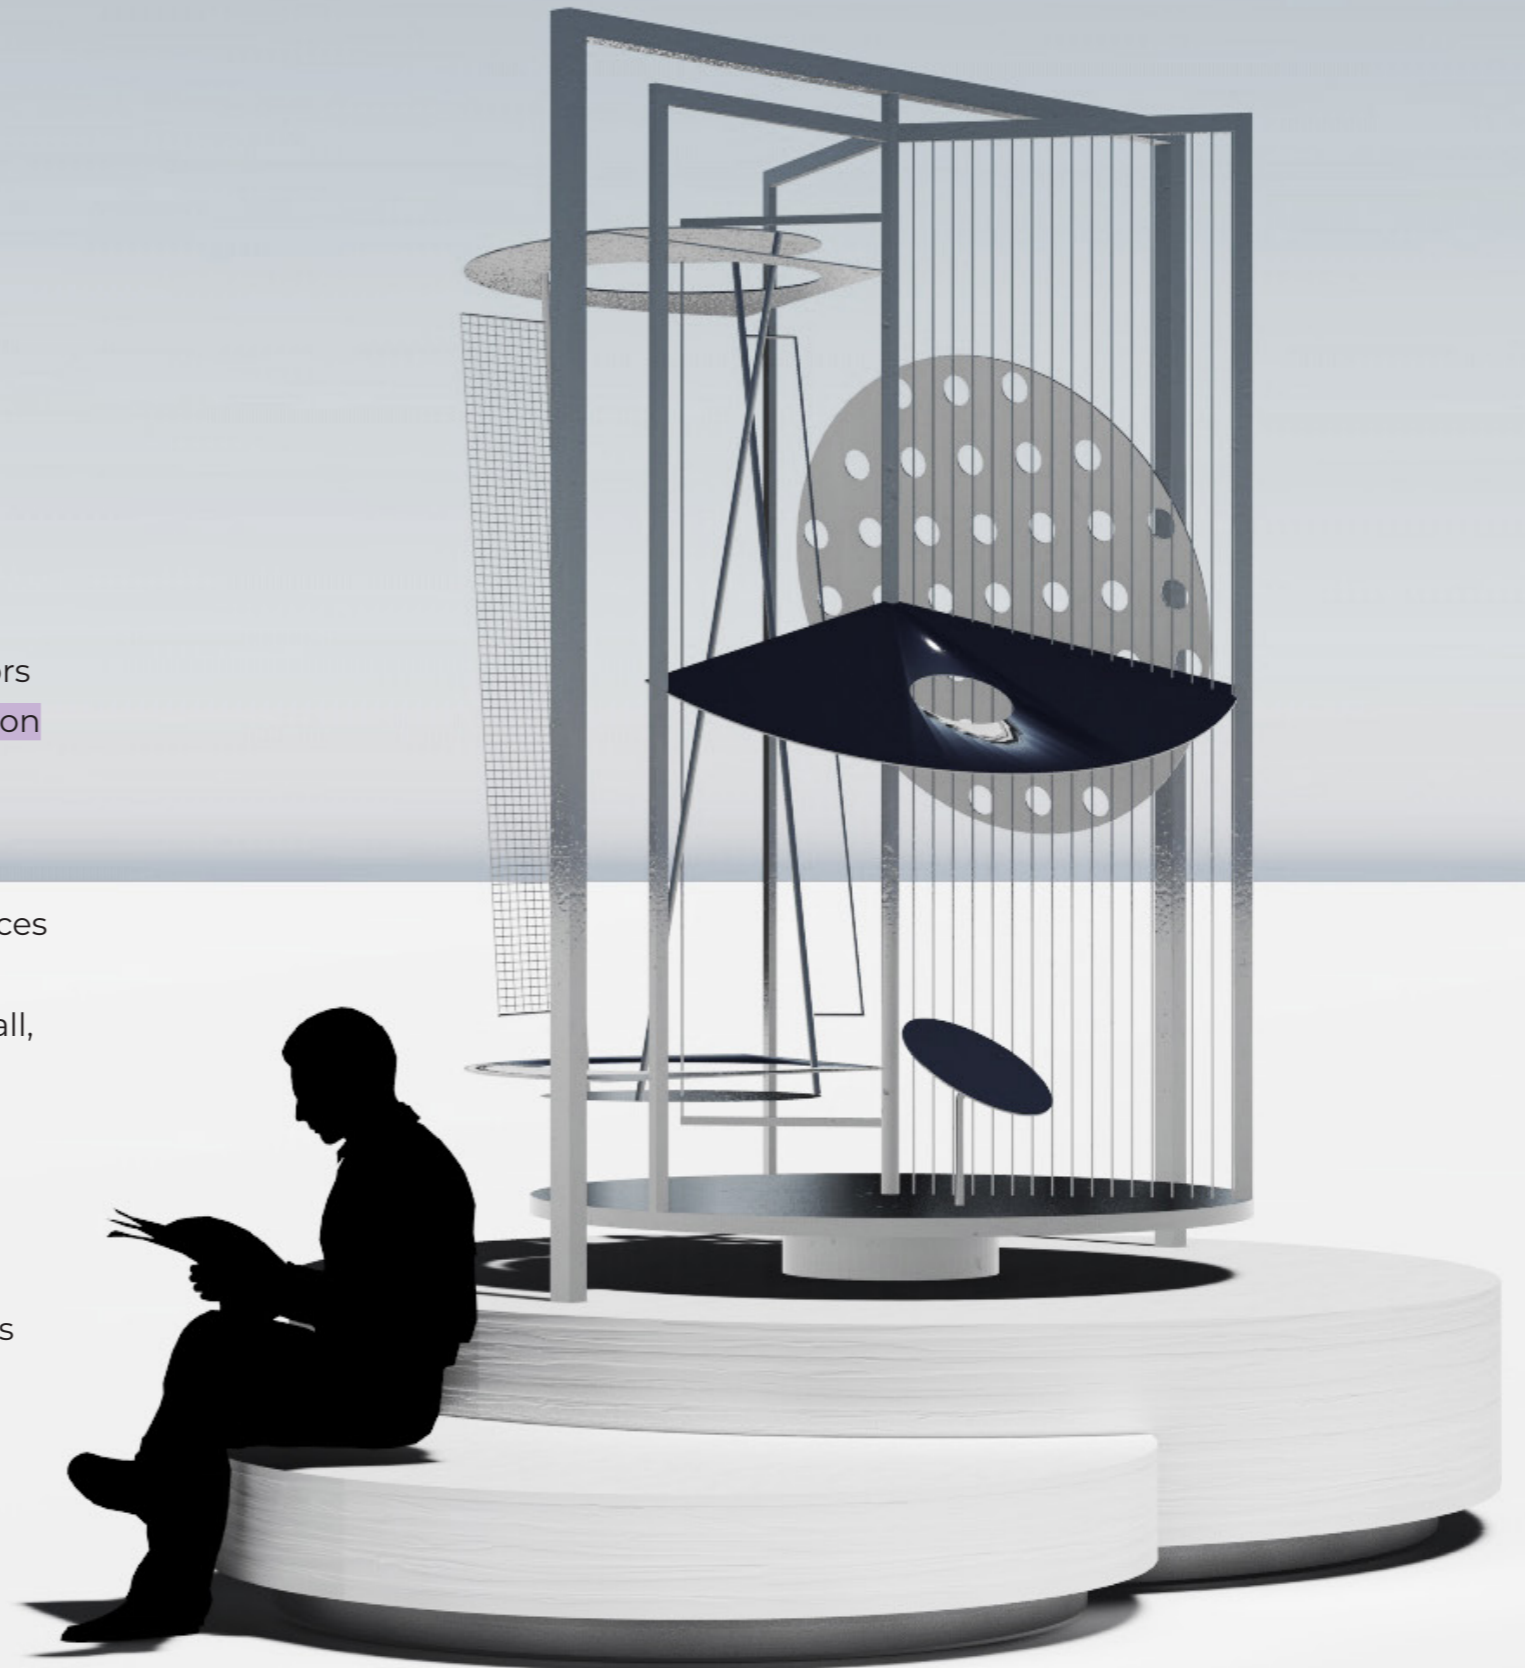

ABOUT THE CONCEPT

The aim was to create a 3.5 meters high kinetic installation to be placed in an **urban environment**.

Inspired by the original artwork of Moholy-Nagy visitors are offered not only to enter the **kinetic light installation** but to sit or stand on surfaces created especially for these purposes.

As the second level of installation, coloured light sources were designed as well as projection facilities for the projection of any moving structure **on any surface** (wall, ground, building, etc.).

The last level of the installation offers an **audio experience** by making audible the generated sounds of the moving components of the installation. Every form has its distinct sound modulated according to its movement.

PROJECTED STRUCTURE

The light sources and projectors around the structure are creating gigantic moving shadows.

LED-STRIP

Every segment of the light stripes can be coloured. The aim is to highlight the basic structure in night and day.

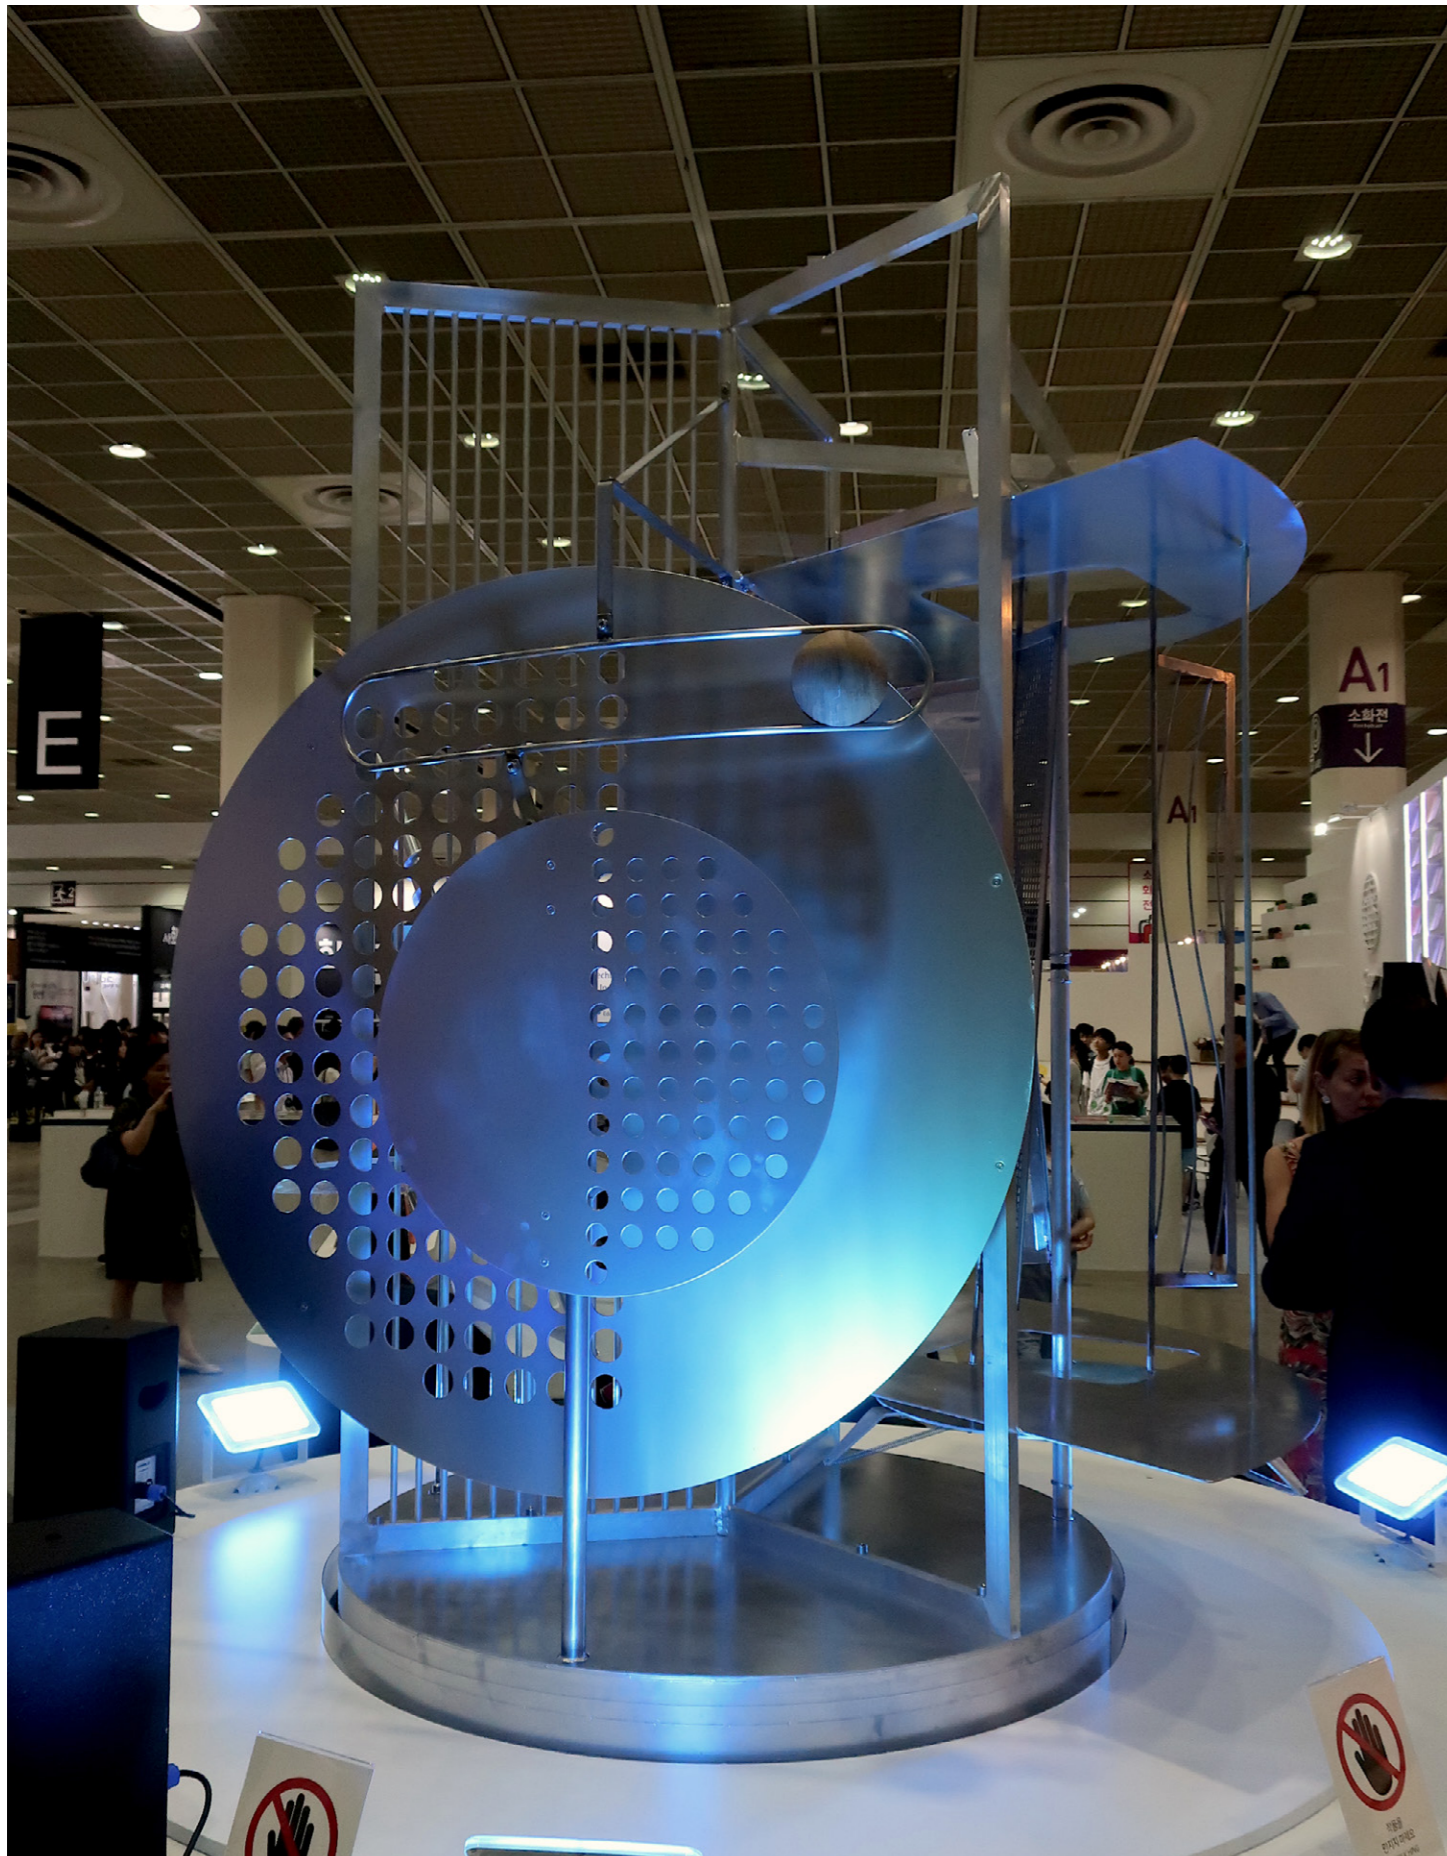

KINETIC SCULPTURE

Based on the idea of the original Moholy's work, the parts are constantly moving.

PLINTH

The plinth is shaped for sitting and standing, and can be supplemented with the following modules:

- Sound speakers (for sound interaction)
- Solar cells (for energy saving)

PRESENTATIONS

The first version of the kinetic sculpture will be presented in Seoul, during the SIBF 2019 as a special guest project.

The second version will be presented presumably in Tel Aviv in October (place TBA) extended with projection.
